

ACS

Access Control and Management System

ACCESS CONTROL AND MANAGEMENT SYSTEM

An Access Control and Management System (ACS) is an essential component of any company or organization's security infrastructure. It restricts access to specific zones and premises, ensuring a high level of protection against unauthorized entry to sensitive areas or valuable resources.

An ACS enables precise identification of individuals attempting to access restricted zones by using various identifiers such as access cards, keys, fingerprints, or other biometric data. Furthermore, the system facilitates comprehensive tracking and monitoring of employee movements within company premises or buildings. For instance, it records employee check-in and check-out times, tracks movement routes, and provides other critical data for the organization's administration and security services.

This information can be used to optimize workflows, enhance operational efficiency, and significantly improve overall security.

Infocom is a partner of ZKTeco, a globally renowned manufacturer of access control and management systems, time tracking solutions, and various biometric identification systems. Our specialists will help you select the most suitable ACS equipment tailored to your needs and provide installation and configuration services, taking into account your business's specifics, existing infrastructure, and the unique requirements of your facilities.

ACS by Infocom Offers:

- Reliable protection against unauthorized access attempts
- 24/7 continuous monitoring and control over all access points
- Minimization of internal threats
- Integration with other comprehensive security systems
- Support and consultation on any system-related issues
